

## Forklift Training Course Tempe

Forklift Training Course Tempe - Industry and federal regulators have established the criteria for forklift safety training according to their current regulations and standards. People wishing to use a forklift should finish a forklift training program before utilizing one of these equipment. The accredited Forklift Operator Training Program is meant to offer trainees with the knowledge and practical skills to become an operator of a forklift.

There are forklift operation safety rules that must be followed pertaining to pre-shift checks, and rules for lifting and loading.

Prior to a shift beginning, an inspection checklist has to be done and submitted to the Supervisor or Instructor. If whichever maintenance problem is discovered, the machine should not be operated until the problem is dealt with. To indicate the machine is out of order, the keys should be removed from the ignition and a warning tag placed in a visible location.

Loading safety regulations consist of checking the forklift nameplate's rating capacity and knowing if the weight of the load falls within capacity. The forklift forks should be in the downward position when the forklift is starting up. Bear in mind that there is a loss of approximately 100 pounds carrying capacity for every one inch further away from the carriage which the load is carried.

So as to safely lift a palletized load, drive the forklift to the pallet and halt with the fork three inches away from the load. Level the mast until it is at right angles to the load. Raise the forks to an inch under the slot on the pallet and drive forward. After that lift forks four inches. Tilt back the load to secure it for moving. Drive the lift in reverse if the load obscures frontal vision. Check behind and honk in order to warn other personnel. Do not allow forks to drag on the ground.

The load should be loaded by the forklift in such a way that ensures the load is secure and will not cause a danger to other people or objects. Restraining loads is required for materials which could shift during transport and destabilize the forklift.

Drums could be strapped together in order to avoid movement and shifting of the drums. Forklift operators should drive slowly when lifting liquids, to decrease instability in the forklift.
