

Boom Lifts

Boom lifts are machinery that has a platform that could be lowered or raised to a range of heights, therefore making this piece of equipment an important necessity in a wide range of professions. Offered in many different specific types such as aerial platform lifts, scissor lift trucks, and knuckle boom lifts, each type functions very specifically.

Aerial lifts are most normally used to carry people at skiing lodges who are not comfortable using a ski lift. These platform lifts maneuver much like an elevator, snowboarders can be gradually moved up the mountain, stopping at stations along the route until they arrive at the top. Aerial platform lifts are also utilized in construction, transporting people safely up and down the sides of multi-level building sites.

Scissor lifts are quite frequently utilized by service businesses as the best approach to securely enable staff to repair and work on cables and wires attached to poles. Telephone, cable television and power companies have relied on the proficiency of this style of boom jack for years.

The knuckle boom lift is built for use within areas of rough ground and where the need to change direction might be required. This style of boom lift has the ability to fit in tight spots where a scissor lift cannot fit. Working between multiple machines in a manufacturing facility or in close proximity between two walls, the knuckle boom also features a standard table fitted with rails for security and worker safety.

The style of boom lift needed by firms will normally depend on the nature of the work required. Fortunately, there are suitable models for nearly any duty.
